

# Achieve Unprecedented Security And Revenue-Focused Inspection Capabilities

Empower your workforce, reduce friction, and increase detection.

The CertScan integration platform was designed by experienced inspection operators responsible for over 60 major inspection sites at ports, borders, and checkpoints around the world. It is a first-of-its-kind software platform designed specifically to engage and optimize multi-site, multi-system security inspection.

CertScan delivers a complete, secure solution for customs inspectors and security operators seeking to perform at the highest levels.

The results:

- accelerated inspection
- higher throughput
- increased seizures
- improved compliance
- more revenue collection

CertScan harmonizes every system and process through a single, friendly user interface, providing an efficient workflow with the ability to govern data for all stakeholders. Every inspection can be seen in real time from one dashboard.

### **Built on a foundation of an enhanced user experience, CertScan keeps the inspection workflow running smoothly.**

- Inspection operators have access to the integrated data package combining every piece of data to ensure thorough assessment and decision-making before, during and after the inspection. This includes the x-ray image viewer with the same tools and features as each machine.
- Inspection analysts see the x-ray image view and data panel in one window for a comprehensive look at all inspection details and confident decision making.
- CertScan tracks and archives every user action, providing an ideal record for audits, performance reviews, and continuous quality improvement.
- Users can share unique inspection information via the Be On the Look Out (BOLO) alerts sent across the operation to highlight trends and anomalies.

### **CertScan Services**

- Headquarters: monitor the whole operation live on your dashboard and through the archive, audit and reports
- Supervise: manage your site systems, processes and people live on your dashboard and through the archive, audit and reports
- Analyze: use every data point in the integrated data viewer to adjudicate inspections
- Coach: live situational management with circular training for people through S2 University and machines through artificial intelligence services
- Systems: monitor cybersecurity services, asset management and system health

S2 Global, an OSI Systems company, is a world class leader in detection system implementation, integration, training, staffing and maintenance. Our dedication and experience has resulted in a suite of systems, knowledge and experienced personnel available on-demand for clients of all sizes.
